Re: New Runoff

A bound version of the new runoff for public consumption now resides at >udd>PDO>Capps>manuscript>public>runoff (rf) on the MIT machine. There is only one functional difference between this and the old runoff: The table for translating unprintable characters into mnemonics in the .chars file is implemented as two tables rather than as one. This difference, which will be removed soon, affects only those runoff files which refer to the CharTable builtin symbol.

If anyone should find any bugs, I would like to have re access (Capps.PDO) to the source file(s) which display(s) the effect of the bug.
