DATE: June 21, 1973

TO: Distribution

FROM: John Gintell

SUBJECT: Multics Project "Library"

A new library is being established for the Multics Development group.
It will be used as a repository for experimental programs (either new
programs or new versions of standard programs), tools that are not up
to installation standards or of general interest, info segments applying
to these programs or other issues specific to the Development group such
as the development machine schedule.

This library is composed of the following directories:

>udd>Multics>library>info   for info segments,

>udd>Multics>library>executable   for executable programs or exec_coms.

>udd>Multics>library>source   for the source programs,

>udd>Multics>library>object   for the archives used to create the
                                       bound segment,

>udd>Multics>library>lists   for maps and other related information.

If you have something to be "installed" in this library, please send me mail
giving pathnames and instructions or an exec_com which can be used to install
it. An info segment should be provided to describe the program. This library
will be organized like the standard system libraries and the standard tools
will eventually be used to perform the actual installations.
