Identification

Change to BQ.4.01  
C. Marceau

Purpose

In order to make it easier for the system administrator to create, modify, and read the dedicated console list, this document changes it from a PL/I structure to an ascii text file. This eliminates one level of sophistication in administrative commands, which may simply use the edit and print commands to modify and print the dedicated console list.

Change

On p. 3, the section labelled "Implementation" should read as follows: "The dedicated console list is an ascii text file such as can be written by the Multics edit command (see BX.9.01). The file has the form

registry file name of console <NL>

name of corresponding user <NL>

project id of user <NL>

registry file name of console <NL>

·  
·  
·

and so on."
