Identification

Return Process-Group Id
get_group_id
K. J. Martin

Purpose

The function get_group_id returns to the user the 50-character
identification of the process-group in which it is called.
The function is provided as a buffer between the user
and the data base in which the information is kept.

Usage

```
dcl (get_group_id external entry, char_string) char(50);

char_string = get_group_id;
```

Implementation

The get_group_id function accesses the data base segment,
process_info, described in BD.6.11. It returns to the
user a 50-character value obtained by concatenating the
items of the structure stored at process_info$process_
group_id. The character string has the form person's
name||project name||instance id. Suitable EPL statements
are:

```
get_group_id: proc char (50);

    dcl 1 process_info$process_group_id ext,
        2 name char (24),
        2 project char (24),
        2 instance_tag char (2);

    dcl group_id char (50);

    group_id = string (process_info$process_group_id);

    return (group_id);

    end get_group_id;
```
