Identification

command_error
W. H. Southworth

Purpose

Command_error is an error handling routine provided primarily for the use of file system commands to print a meaningful comment given a file system error code.

Usage

```
    call command_error (code, string);  
or   call command_error (code);  
where code is fixed binary and string is a character  
string.
```

Implementation

Command_error will look up the code in fscodedinfo and print a message of the form

```
    error message  
if a string is not provided to command_error, or of  
the form  
    error message: string  
if a string is provided.
```

Error message is a character string of the form

```
    error 3528  
if the code is not found in fscodedinfo, or  
    noentry  
if the code is found
```

Examples

```
noentry:    >system_library>zilch  
error 2023: invalid string  
noaccess
```
